myQ

Secure your print environment, monitor all devices in the network, create powerful reports and enjoy the freedom of mobile print.

Also suitable for commercial use.

SMART EDITION

Quick deployment of MyQ

MyQ takes **just a few minutes to install**, thanks to the built-in quick setup guide. The entire printer fleet, be it a single device or thousands of them, is automatically discovered, added and made ready for users.

Device management from a single spot

Thanks to the feature of monitoring local and network devices, **MyQ supplies regular updates on device status,** as well as information about the current level of consumable resources and any current malfunctions of individual devices. Has your printer run out of toner? Is the paper jammed, or is there another technical issue with the device? MyQ sends a notification about it immediately.

Flexibility with Mobile Print

Mobile printing by MyQ is more than just printing from a smart device. MyQ enables users to log in and manage their jobs through smartphones or tablets with the help of the MyQ Mobile App (iOS and Android) – print files, securely release jobs, recharge credit, unlock devices, and more from the device always keep at hand.

AirPrint, e-mail print and Mopria are also an easy option once the MyQ Mobile Print Agent is set up. Your business partners, hotel guests or other esteemed visitors will be able to print their jobs straight away, without needing to install any drivers.

End-to-end Security

As a rule, **MyQ secures all data in the network,** using database encryption, end-to-end secured job transfer, as well as by offering advanced watermark options with multiple settings definable by users.

Print jobs are also protected by authentication when using pull printing with MyQ Mobile Print.

myQ

Enjoy a **fully personalized device UI** which only displays functions the user needs. Improve efficiency with a powerful one-click scanning workflow.

ENTERPRISE EDITION

A fully personalized device UI – the **MyQ Embedded Terminal**

A **user-friendly interface** that is easy to understand. For example, if a user mostly uses the MFP to color-scan documents to their e-mail, that function can be pre-set to appear as the first thing on the screen, alongside other print and copy options they use most often.

Functions displayed on the screen can be adjusted for a specified group of users, e.g. departments, as well as for a single user or machine.

Expanded Pull Printing

Pull printing with MyQ allows users to **completely control** the release of their jobs with access after authentication by ID, PIN, username and password. **Users' jobs are securely stored** within the MyQ Server and wait until the owner **releases them at the device of their choice.**

MyQ Theme Editor

Visual themes and backgrounds set as default on the UI can be easily replaced with **the company's brand colors and logo,** giving the terminal a much more personalized feel. The admin can also upload a set of different icons for the tiles. All of this is done with the help of **MyQ Theme Editor.** Hand in hand goes the option to choose out of 35 languages in which the UI will communicate with the user.

Scanning & Workflow to e-mail, folder or cloud

Thanks to personalized scanning profiles, a given task can be **sent to more destinations with a single push of a button.** A document can be sent simultaneously to your own mailbox, to a cloud repository using a secured link, to a supervisor's folder, etc. Enjoy a **built-in OCR functionality without any extra costs.**

myQ

Digitize your organization with MyQ Ultimate Edition, which builds upon the MyQ Enterprise Edition by adding first-class **OCR software and document processing options.**

ULTIMATE EDITION

Advanced document processing

This function enables users to easily scan various documents – such as invoices, orders, contracts, forms, questionnaires, production lists, etc. – and the software **automatically extracts all contained data** and stores it in editable format to a selected destination. This saves time otherwise spent on retyping the data into the system manually.

The function not only recognizes text, but also checkboxes, the presence of stamps or signatures, and **is able to process barcodes or QR codes** using advanced OCR engines.

Excellent document availability
thanks to various connectors

Documents can be stored in various systems, thanks to the connectors it supports. Companies can easily integrate MyQ with **existing Document management systems, platforms or cloud drives.** Users can then browse and search in folders, or **create new folder structures** directly from the device panel.

Smart Workflows

Smart Workflows significantly reduce time spent on scanning. Scanned documents can **automatically be separated, classified, processed and stored** in any supported destination, based on their type or information contained. This minimizes the need for the user's intervention, as most of the decisions they would otherwise have to make can be predefined in the internal system.
